How-to Guide: Make Accessible Study Aids with AI

Repeat this process for any chapter section: simpler text, audio and a visual summary. Free tools only.

Before you start

Pick **one short section (about 2 pages)** from an open resource such as NCERT or OpenStax. Use only free plans. Never upload personal data. Label everything AI makes as **AI-generated** and credit the source.

The 8 steps

Step	What to do	What to check
1. Prepare the source	Copy the section text. Keep the original untouched. Upload it to NotebookLM as a source.	The section is short and from an open, credited resource.
2. Simplify text	Run the **same prompt** in ChatGPT, Gemini and NotebookLM. Rules: sentences under 15 words, explain each term, keep formulas and units exactly, add no new facts. Save each output with the tool name.	All three tools got the same text and the same prompt.
3. Verify and log errors	Compare each output line by line with the original. Use a table: Tool | What AI wrote | What the source says | Error type | Severity | Fix.	Formulas, exponents, units, added facts, lost precision (for example "increases" vs "directly proportional"), leaked tags, LaTeX.
4. Merge and fix by hand	Take the most accurate facts from one tool and the clearest layout from another. Rewrite formulas in plain text.	Every number matches the source. Fix log is written.
5. Make the audio	Run an audio prompt on the corrected text. Spell numbers, formulas and powers of ten in words. Merge the best script. Record it in ElevenLabs (free tier).	Listen to all of it: misread numbers or names. Length 2 to 3 minutes. No tool offers or emojis in the script.
6. Make the visual	Ask for a mind-map outline (5 to 6 branches, 2 to 3 points, under 8 words each). Build it in Canva: large text, clear sans-serif font, left-aligned, 3 colours at most. Add alt text.	Pictures match the text (no open switch beside a glowing bulb). No garbled labels. Add the AI label.
7. Peer review	Send a Google Form to 3 peers with different needs (text, listening, pictures). Keep it anonymous. Link it to Google Sheets for averages.	Rate clarity and usefulness (1 to 5). Fix any mistake they find and note the change.
8. Document	Save all prompts, outputs, error logs, the fix log, peer results and a before/after comparison.	Everything is labelled with tool name and date.

Tips that saved time

• **NotebookLM:** upload the source first and paste only the rules. If it replies with an offer, type "Write the full output now."
• **Copy outputs as plain text:** LaTeX, citation numbers and source tags often come along and break formulas.
• **Watch for added words** that are not in the source (for example "tiny"). If a tool names a source you did not give it, remove it.
• **Regenerate only the part that failed**. Free-tier credits are limited.

Limits to remember

AI can change meaning while sounding confident. In this project every tool made at least one error, from broken exponents to a wrong definition. Accessible does not mean complete: shorter points drop detail. Always have a human check the output against the source, and use AI to support teachers and assistive tools, not replace them.

Based on Capstone 14: NCERT Class 10 Science, Chapter 11, Section 11.1. AI-assisted guide, checked by the student.
